

Structure-electronic consensus audit using existing data only

Candidate desirability, same-seed similarity, and 2D visualization are kept as separate claims

Why the previous pictures disagree

Complete cases: 2,137

High-zT reduced formulas: 10 (drawn on 33 JARVIS structures)

Top-30 old-vs-independent candidate overlap: 1/30

Independent top-30 dual candidates in direct AND top 10%: 3/30

Strict consensus candidates shown in purple: 21

Old purple definition

joint-manifold proximity was multiplied into the colour score;
visual proximity was therefore partly selected in advance.

Current hollow cyan stars

are reduced-formula matches, not phase-resolved samples.

Examples include C: $g=0.45$; SnS₂: 3L;

Si: nano-bulk Si(model); InP/GaP: Reference.

Interpretation

Purple means: predicted desirable transport AND close to the same high-zT formula in both descriptor views. It is a screening rule, not independent evidence of high zT.
